GOVERNMENT COLLEGE OF ENGINEERING

ERODE – 638 316

RECORD NOTE BOOK

Register Number:

Certified that this is the bonafide record of work done by Selvan/Selvi ____of Sixth Semester B.Tech. Information Technology branch during the academic year 2025 - 2026 in the **CCS356 – Object Oriented Software Engineering**.

Staff Incharge   Head of the Department

Submitted for the university practical examination on __________________

at Government College of Engineering, Erode

PASSPORT AUTOMATION SYSTEM

AIM:

To design and develop Passport Automation System.

PROBLEM STATEMENT:

To develop a Passport Automation System. The system developed should contain the following features:

This system adopts a comprehensive approach to minimize the manual work and schedule resources, time in a cogent manner.
The client registers the application form to the system along with the personal details and certificates as a proof.
This application form is received and will be validated by the system.
After validation this application will be processed by the following procedures like

- Police verification
- Doctor verification

After verification and clearing these steps and procedures the administrator should issue passport for the applicant.

PASSPORT PROCESSING MODULE:

This module starts when the applicant registers the form to the automation system.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS:

1. 128MB RAM
2. Pentium III Processor

BOOK BANK MANAGEMENT

AIM:

To design and develop Book Bank Management.

PROBLEM STATEMENT:

To develop a Book bank management system. The system developed should contain the following features:

This system adopts a comprehensive approach to minimize the manual work and schedule.

The administrator should enter into the system using his/her personal username and password.

The administrator should provide query for outdated/damaged books/magazines etc.

The system checks for any damage for the particular book.

The system should display about the damaged books and also the outdated magazines.

The administrator should check and provides the action like verify,borrow, reserve, return books, notification of books through the system.

The library inventory involves the actions like add book and remove book.

BOOK BANK MANAGING MODULE :

This use case starts when the librarian enters the system using his/her username and password.

Flow of Events:

- **Basic flow:**

The use case starts when the librarian enters the system using his/her username and password to the system.

The administrator should provide query for outdated/damaged books/magazines etc.

The system checks for any damage for the particular book.

The system should display about the damaged books and also the outdated magazines.

The administrator should check and provides the action like verify,borrow,reserve,return books,notification of books through the system.

The library inventory involves the provides the actions like add book and remove book

- **Alternative flow:**

If the librariandoesn't provide the correct valid username and password, then he/she application will not be able to enter or access the system.

- **Pre- condition:**

None

- **Post- condition:**

After completion of this use case, the information of the book bank management will be maintained by the system and stored in the system's database.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS:

EXAM REGISTRATION SYSTEM

AIM:

To design and develop Exam Registration System.

PROBLEM STATEMENT:

To create an Exam registration software that will meet the needs of the applicant and help them in registering for the exam ,enquiry about the registered subject ,modification in database and cancellation for the registered project.

OVERALL DESCRIPTION:

The Exam Registration System is an integrated system that has four modules as part of it.the four modules are

1. Registration for the exam

In this module, the user can select the subject to register for the exam, Enquiry about the registered subject, Modification in the student database, canceling the registered subject.

2. Form for Registration

In this module the user can apply for the exam by giving the details about the candidate and selecting the subject for the registration.

3. Modification in the Database

In this module the user can change the data's like the phone number, address can be done.

4. Cancellation for the registered subject

In this module the user can cancel their name which is registered for the exam.

SOFTWARE REQUIRMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access

STOCK MAINTENANCE SYSTEM

AIM:

To design and develop Stock Maintenance System.

PROBLEM STATEMENT:

INVENTORY SYSTEM is a real time application used in the merchant's day to day system. This is a database to store the transaction that takes places between the Manufacturer, Dealer and the Shop Keeper that includes stock inward and stock outward with reference to the dealer. Here we assume our self as the Dealer and proceed with the transaction as follows:

The Manufacturer is the producer of the items and it contains the necessary information of the item such as price per item, Date of manufacture, best before use, Number of Item available and their Company Address.

The Dealer is the secondary source of an Item and he purchases Item from the manufacturer by requesting the required Item with its corresponding Company Name and the Number of Items required. The Dealer is only responsible for distribution of the Item to the Retailers in the Town or City.

The Shop Keeper or Retailer is the one who is prime source for selling items in the market. The customers get Item from the Shop Keeper and not directly from the Manufacturer or the Dealer.

The Stock is the database used in our System which records all transactions that takes place between the Manufacturer and the Dealer and the Dealer and the Retailer.

ONLINE COURSE REGISTRATION SYSTEM

AIM:

To design and develop Online Course Registration System.

PROBLEM STATEMENT:

The course registration system will allow students to register for courses and view report cards from personal computers attached to the campus LAN as well as over the Internet. Professors will be able to access the system to sign up to teach courses as well as record grades.

The legacy system performance is rather poor, so the new system must ensure that access course information from the legacy database but will not update it. The registrar's office will continue to maintain course information through another system.

At the beginning of each semester, students may request a course catalogue containing a list of course offerings for the semester. Information about each course, such as professor, department, and prerequisites, will be included to help students make informed decisions.

The new system will allow students to select four courses offering for the coming semester. In addition, each student will indicate two alternatives choices in case the student cannot be assigned to a primary selection. Course offerings will have a maximum of ten students and a minimum of three students. A course offering with fewer than three students will be canceled. For each semester, there is period of time that the students can change their schedule. Students must be able to access the system during this time to add or drop courses. Once the registration process is completed for a student, the registration system sends information to the billing system so the student can be billed for the semester. If a course fills up during the actual registration process, the student must be notified of the change before submitting the schedule for processing.

At the end of the semester, the student will be able to access the system to view an electronic report card. Since student grades are sensitive information, the system must employ extra security measures to prevent unauthorized access.

AIRLINE/RAILWAY RESERVATION SYSTEM

AIM:

To design and develop Airline/Railway Reservation System.

PROBLEM STATEMENT:

SCOPE:

To design and implement a online reservation system for railway that provide train details and issue tickets. The system prepares the ticket for passengers through the online. The system provides payment details maintain the train details and passengers details.

FUNCTIONALITY:

- Reserve tickets, cancel tickets, ticket fare and train details done by customer.
- Update train details done by administrator.
- Payments are paid by customer.

Update train details:

Only the administrator enters only changes related to the train information like change in the train name, train number, train route etc in the system.

View train details:

Previsions should be given to see information related to the train schedules be able to see the train name, train number, boarding and destination stations and duration of journey etc.,

Payment:

The customer can pay the amount by online or credit cards.

Reserve ticket:

Customer can reserve the ticket by filling the train name , boarding and destination stations and His/Her name address in the system.

Cancel ticket:

Customer can also cancel the ticket which is already reserved by using online.

View ticket fare:

Customer can see the fare of ticket for journey and some more details in the system.

Overall Description

Administrator:

The administrator can update the train details.

Customer:

To use this service people should have the basic computer using ability. They shall see the train information which is belong to current time.

External users:

External users are people who have not got any user account for the website.

Ticket reservation:

Customer can reserve the ticket by filling the train name, boarding and destination stations and his/her name, address in the system.

Ticket cancellation:

Customer can also cancel the already reserved ticket through online.

Update train details:

Administrator can enters any changes related to the train information like change in the train name, train number, train route etc.

Payment:

The customer can pay the amount by online credit cards.

Usability:

The system provides the facility to customer for buy the ticket through the online system. The system provides anytime any place service for the customer. The system provide check facility for time departure and arrival of train. To ease the ticket payment by online (or) credit card.

SOFTWARE PERSONNEL MANAGEMENT SYSTEM

AIM:

To design and develop Software Personnel Management System.

PROBLEM STATEMENT:

To compute the gross pay of a person using the software personnel management system software and to add new details to the existing database and update it, using visual basic 6.0 and MS Access

OVERALL DESCRIPTION:

The three modules are

1. **Entry form**

The employee details, edit details and exit command buttons are present. We can choose the required command button.

2. **Pay slip form**

Fill in the form with details such as employee id, employee name, department, experience, and basic pay in the text boxes and submit using CALCULATE command button Update it in the database using UPDATE command button.

3. **Database form**

Updated database would be present. We can search for the required Pay details using SEARCH command button.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS :

1. 128MB RAM
2. Pentium III Processor

STRUCTURE OF DATABASE:

Create a table “conf” using Microsoft access with the following attributes:

S.NO	FIELD	TYPE	SIZE
1.	Employe ID	number	10
2.	Employee name	varchar	30
3.	Department	varchar	10
4.	Experience	number	2
5.	Basic pay	number	5
6.	HRA	number	5
7.	PF	number	4
8.	GPAY	number	8

CREDIT CARD SYSTEM

AIM:

To design and develop Credit Card system.

PROBLEM STATEMENT:

To develop a Credit Card system. The system developed should contain the following features:

- The customer login into the system using credit card number and pin number. The system for validation.
- The system queries the customer for type of accounts either SB account or credit. After getting the type of account the system shows the amount left.
- The system then queries the customer for required amount. The user enters the amount and gets the money.

OVERALL DESCRIPTION :

Login Module

This case start the actor wishes to log into Course Registration System.

Maintain Customer Information Module

This use case starts when administrator wishes to add, change and/or delete customer information I system.

Transaction Module

This activity starts when customers want to withdraw amount from account.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

E-BOOK MANAGEMENT SYSTEM

AIM:

To design and develop E-Book Management System.

PROBLEM DOMAIN

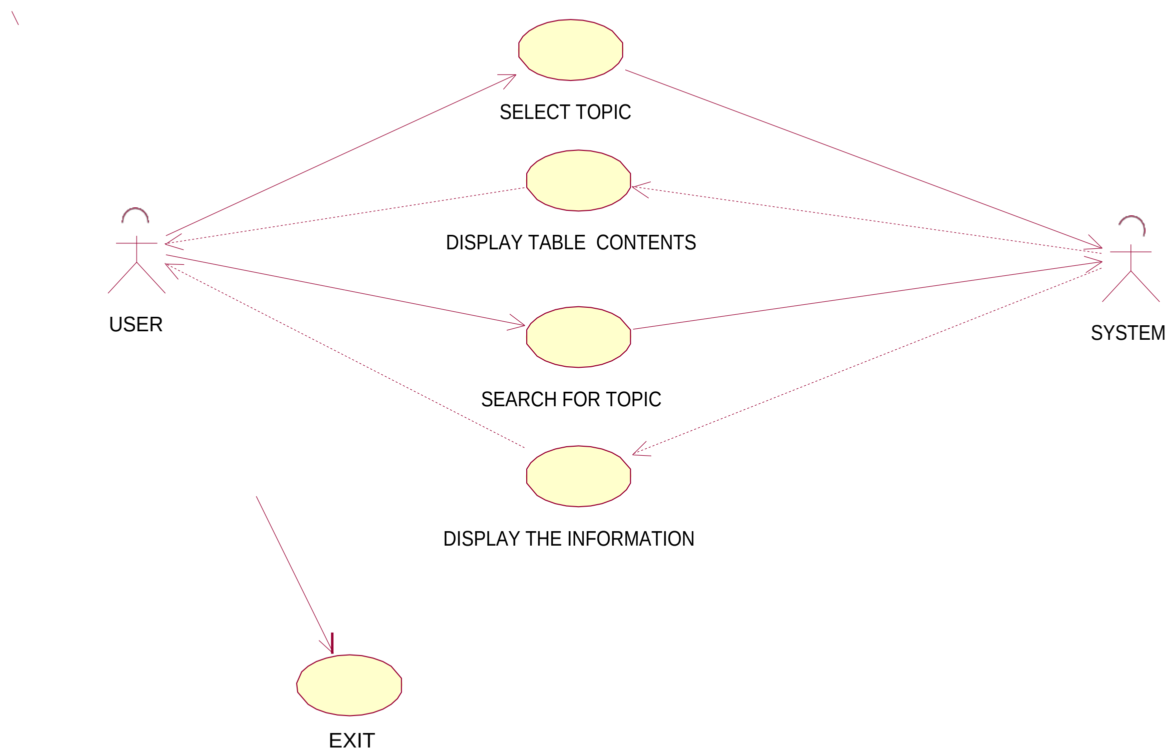
INTRODUCTION:

This E-BOOK should contain index of the topics. When the main page is visited index of the topics is displayed. Select the required topic and double click on it. Then the page with the contents of the selected topic will be displayed. A certain option is also present in that page to go back to main page and search for other topics.

STEPS:

- Create a main page.
- Main page contains index of certain topics.
- When a particular topic is required double click on it.
- It displays a page with the contents of that topic.
- A separate option is present to go back to main page.

USE-CASE DIAGRAM:



DESCRIPTION:

Use case diagrams describe what a system does from the stand point of an external observer. The emphasis is an;

"What a system does rather than how it does"

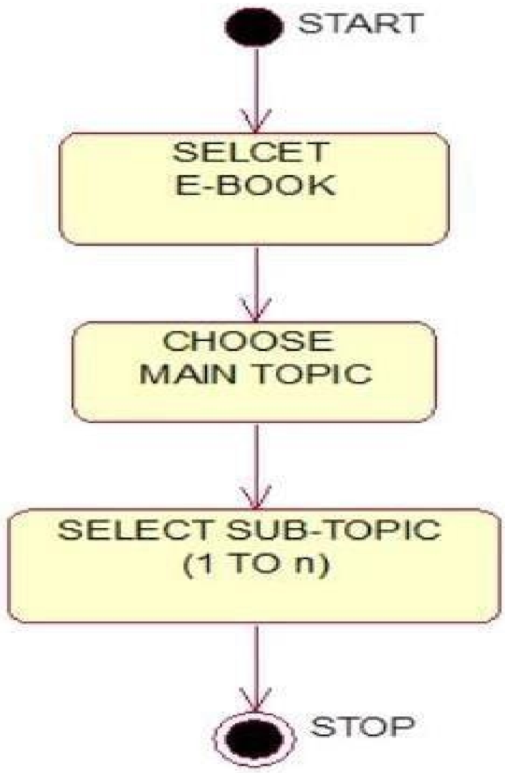
Use case diagram are helpful in 3 cases:

Use case often generates new requirement as the system is analyzed and the system is analyzed and the design takes shape.

Communication with clients.

Generating test cases.

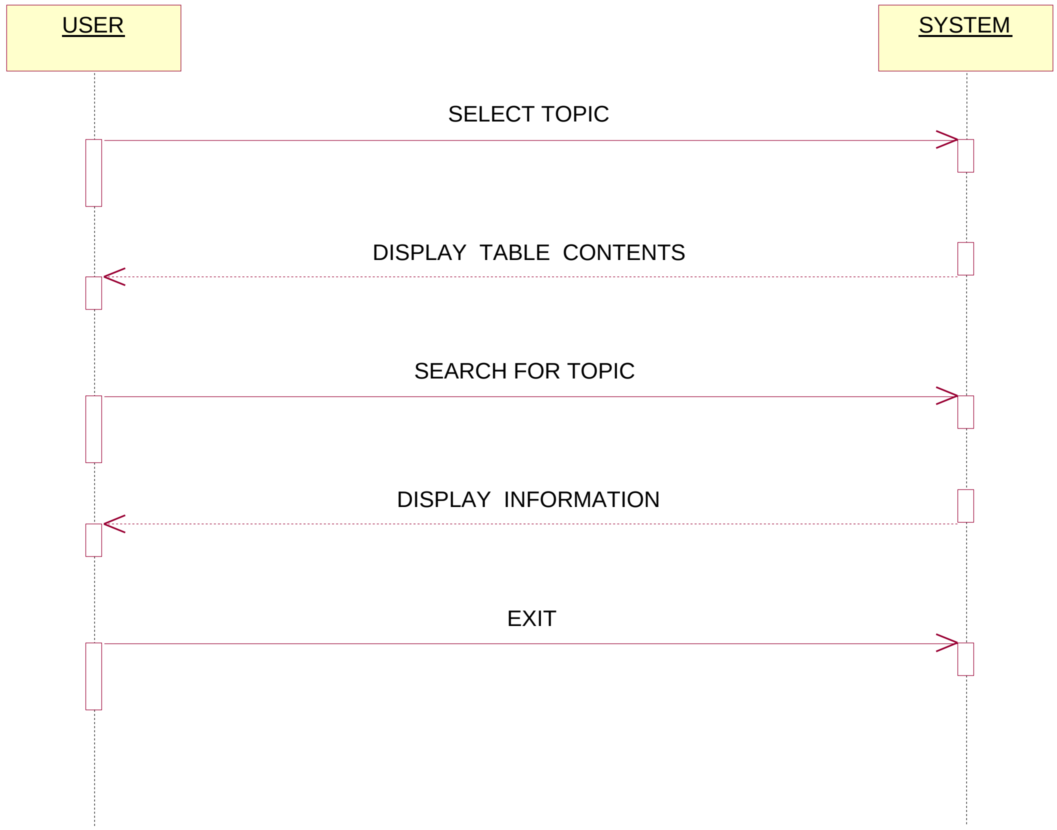
ACTIVITY DIAGRAM:



DESCRIPTION:

- Activity diagram focus on the flow of activity involved in the single process.
- Activity diagram shows how the activities depend on the another.
- It is essentially a **FANCY** diagram.
- Activity diagram is closely related with State chart.

SEQUENCE DIAGRAM:



DESCRIPTION:

- Sequence diagram is an interaction diagram which is dynamic
- Sequence diagram gives information such as:

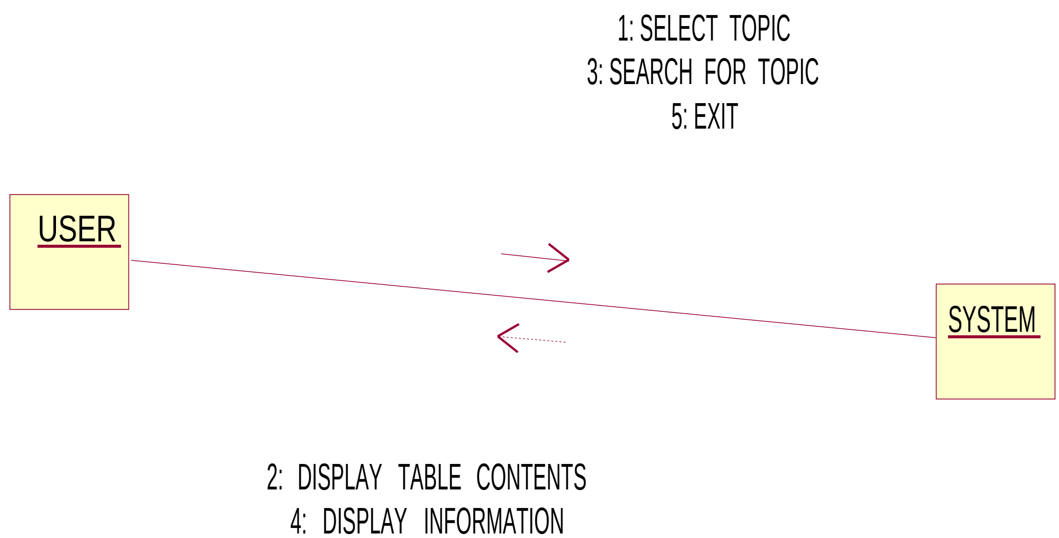
  How operations are carried out.

  What messages are sent?

  When sequence diagrams are organized according to time.

The objects involved in the operation are listed from left to right according to when they take part in the message sequence.

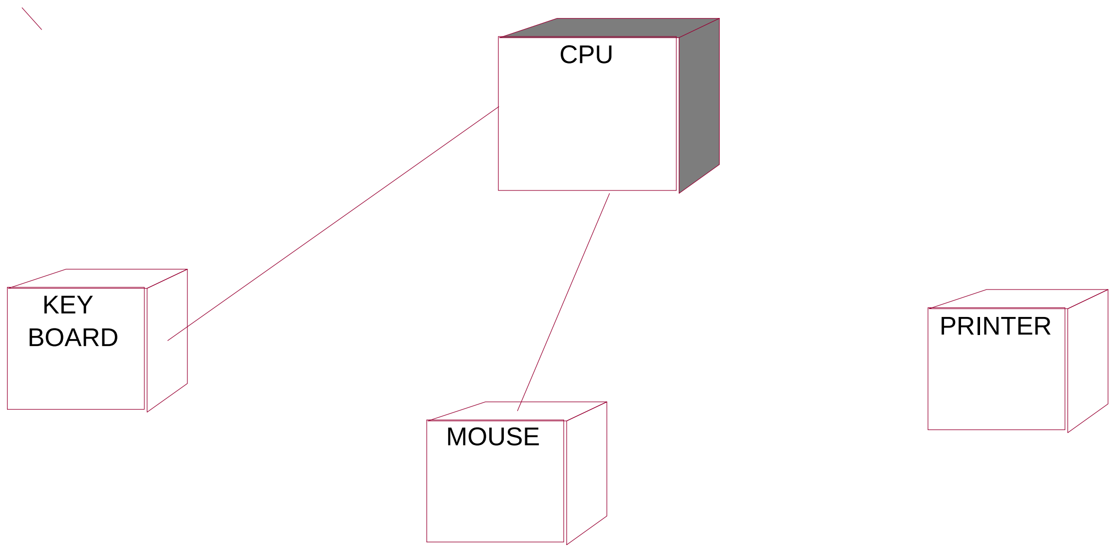
COLLABORATION DIAGRAM:



DESCRIPTION:

- Collaboration diagram are interaction diagram which are dynamic.
- Collaboration diagram focuses on object role instead of times that message are sent.
- Each message in the collaboration diagram has a sequence number.

DEPLOYMENT DIAGRAM:



DESCRIPTION:

- Deployment diagram is also called as component diagram.
- The component is code module.
- Component diagram are physical analog of class diagram.
- It shows the physical configuration of hardware and software.

                <p>
In the 1980's many methodologists were wondering how analysis and design methods and
processes would into an object oriented world. object oriented method have suddenly become
popular. The trend in object oriented methodologies sometimes called second generation object
oriented methods.<br>
                </p>
                <p>
To get a feel for object oriented methodologies let us look at some of the methods developed in
the 1980's.<br>
                </p>
                <p>
```

```
        *1986.BOOCH[6] developed the object oriented design concept the BOOCH
method.<br>

        *1989.Beck and Cunningham produced class-responsibility-collaboration cards.<br>
                </p>

RECRUITMENT SYSTEM

AIM:

To design and develop Recruitment System.

PROBLEM STATEMENT:

To create a software system this can test the skills of the candidate by generating random question and answer and implementing using Visual basic 6.0 and MS Access.

OVERALL DESCRIPTION:

The three modules are

1. Login

User can login using the username and password and they can start attend the test for the specified vacancy

2. Recruitment test

This system will generate random question to test the skills of the Candidate and check whether the candidate is suitable for the position offered by the company.

3. Result

This will show whether the candidate is selected or not selected for the position by displaying the message.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS

1. 128MB RAM
2. Pentium III Processor

FOREIGN TRADING SYSTEM

AIM:

To design and develop Foreign Trading System.

PROBLEM STATEMENT:

The steps involved in Foreign Trading System are:

The forex system begins its process by getting the username and password from the trader. After the authorization permitted by the administrator, the trader is allowed to perform the sourcing to know about the commodity details.After the required commodities are chosen, the trader places the order.The administrator checks for the availability for the required commodities and updates it in the database. After the commodities are ready for the trade, the trader pays the amount to the administrator.The administrator in turn provides the bill by receiving the amount and updates it in the database.The trader logouts after the confirmation message has been received.

FORGEIN TRADING SYSTEM MODULE: :

This use case starts when the user enters the system using his/her username and password.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS:

1. 128MB RAM

CONFERENCE MANAGEMENT SYSTEM

AIM:

To design and develop Conference Management System.

PROBLEM STATEMENT:

This project deals with the conference management system .As a students or staff members are required to view the details of conference is going to conduct in various colleges or institutions and to attend the conference to gain knowledge from the conferences . Administrator will add the details about the various conferences available to attend for various department students and staff members.

User will enter into the system by giving the username and password and selection form will be displayed for the user from that department should be selected and depending up on the department the conference management system will show the details of the conferences in various place using Ms Access and Visual basic 6.0.

OVERALL DESCRIPTION:

2. Login Form:

Authenticate the user and administrator.

3. Department Selection Form:

This form will give the options for selecting the department to get knowledge about the conference.

4. Conference view Form:

This form contains the details about the conferences is conducting by various institutions and we can see the date and time for the conference.

5. Database Form:

The details about the conferences going to conduct by various institutions. Administrator can add the details about the conference for the students and also for the staff members.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0
2. Rational Rose
3. Microsoft Access.

HARDWARE REQURIMENTS:

1. 128MB RAM
2. Pentium III Processor

STRUCTURE OF DATABASE:

Create a table "conf" using Microsoft access with the following attributes:

S.NO	FIELD	TYPE	SIZE
1.	dname	varchar	20
2.	conferdet	varchar	40
3.	collname	varchar	20
4.	date	Text	10
5.	time	Text	05

BPO MANAGEMENT

AIM:

To design and develop BPO Management.

PROBLEM STATEMENT:

To develop a BPO Management System. The system developed should contain the following features:

This system adopts a comprehensive approach to minimize the manual work and schedule resources, time in a cogent manner.

The client places a project order to the system and also providing the requirements for the particular project.

The BPO employee enters into the system and selects the project.

The employee classifies the project into voice and on voice based mode.

Then the same project into classified into outsourcing service type(IT/SOFTWARE, BACKOFFICE/ACCOUNTING/FINANCIAL/KLNOWLEDGE BASED).

The BPO employee processes the project and finally submits the project.

The project is delivered to the client if the payments are received.

PROJECT PROCESSING MODULE:

This use case starts when the client places the order to the BPO management system..

Flow of Events:

- **Basic flow:**

The use case starts when the client places a project order to the system and also providing the requirements for the particular project. The BPO employee enters into the system and selects the project. The employee classifies the project into voice and on voice based mode.
Then the same project into classified into outsourcing service type like:

IT/SOFTWARE
CUSTOMER INTERACTION
BACKOFFICE
ACCOUNTING
FINANCIAL
KNOWLEDGE BASED.

The BPO employee process the project and finally submits the project.
The project is delivered to the client if the payments are received.

- **Alternative flow:**

If the BPO employee doen't classify the service type into voice or non voice based mode, then error occurs and the project cannot be processed.

- **Pre- condition:**

None

Post- condition:

After completion of this use case, the information of the Client and project will be maintained by the system.

SOFTWARE REQURIEMENTS:

LIBRARY MANAGEMENT SYSTEM

AIM:

To design and develop Library Management System.

PROBLEM STATEMENT:

The library management system is a software system that issues books and magazines to registered students only. The student has to login after getting registered to the system. The borrower of the book can perform various functions such as searching for desired book, get the issued book and return the book.

LIBRARY MANAGEMENT SYSTEM MODULE: :

This use case starts when the librarian enters the system using his/her username and password.

SOFTWARE REQURIEMENTS:

1. Microsoft Visual Basic 6.0

STUDENT INFORMATION SYSTEM

AIM:

To design and develop Student Information System.

PROBLEM STATEMENT:

The student must register by entering the name and password to login the form. The admin select the particular student to view the details about that student and maintaining the student details. This process of student information system is described sequentially through following steps. The student registers the system. The admin login to the student information system. He/she search for the list of students. Then select the particular student. Then view the details of that student. After displaying the student details then logout.

STUDENT INFORMATION SYSTEM MODULE : :

This use case starts when the students enters the system using his/her username and password.

PAYROLL SYSTEM

AIM:

To design and develop payroll system.

PROBLEM STATEMENT:

To prepare software based on the payroll system that should undergo some of the processes should show the working details of the employee and also to perform and analysis the salary calculation. Salary calculation mainly contains two parts ie. Net and gross pay. Gross pay is calculated by HRA, TA, and DA. Net pay is calculated by reducing loan, LPA, insurance count etc. then the salary report is given.

OVERALL DESCRIPTION :

MODULE 1:

Enter the employee details name and eno

Obtain HRA, DA,PF.

Get the basic pay as per designation.

MODULE 2:

Calculate deductions and allowance percentage.

Calculate the basic pay.

MODULE 3:

Calculate the number of days taken leave.

Calculate the deductions due to leave.

Calculate the net pay after subtracting the net deductions.

Provide salary slip.
